

Homework Assignment #7

HTML5, CSS, Mobile Web Design & Accessibility

Multiple Choice Questions

1. How would you link to the named fragment `#jobs` on the page `employ.html` from the home page of the site?

a. `<a href="employ.html#jobs">Jobs</a>` ✓ Correct

b. `<a name="employ.html#jobs">Jobs</a>`

c. `<a link="employ.html#jobs">Jobs</a>`

d. `<a href="#jobs">Jobs</a>`

2. Which pseudo-element can be used to generate content that precedes an element?

a. :after

b. :before ✓ Correct

c. :content

d. :first-line

3. Which of the following is a mobile web design best practice?

a. Configure a multiple-column page layout.

b. Avoid using lists to organize information.

c. Configure a single-column page layout. ✓ Correct

d. Embed text in images wherever possible.

4. Find the Error

The page below is intended for the navigation area to display on the right side of the browser window. What needs to be changed?

 **Error Found:** The `nav` is set to `float: left` — this places navigation on the **left**. To move it to the right, change it to **`float: right`**. Also, `main` should use `margin-right` instead of `padding-right` to avoid overlap.

✗ Original (wrong):

```
nav { float: left; /* ← Should be float: right */
      width: 120px; }

main { padding: 20px 150px 20px 20px;
        background-color: #ffffff; }
```

✓ Corrected:

```
nav { float: right; /* ← Fixed */
      width: 150px;
      background-color: #cccccc;
      border: 1px solid #000000; }

main { margin-right: 160px; /* ← avoid overlap */
        background-color: #ffffff; }
```

5. Web Research Summary

ACCESSIBILITY & MOBILE WEB — AREAS OF OVERLAP

Introduction

The W3C document "Web Content Accessibility and Mobile Web" (w3.org/WAI/mobile) reveals a striking overlap between mobile web best practices and accessibility guidelines. Many design decisions that help users with disabilities also improve the experience for mobile users.

Key Areas of Overlap

- 1. Alternate Text for Images:** Providing `alt` attributes benefits screen reader users and also helps mobile users who have images disabled to save data bandwidth. In both cases, content remains meaningful without visual images.
- 2. Use of Headings:** Proper heading structure (`h1` – `h6`) helps screen readers navigate content logically. On mobile, clear headings also improve readability on small screens and help users scan content quickly.
- 3. Single-Column Layouts:** A single-column layout is a mobile best practice for smaller screens. It also benefits users with low vision or

cognitive disabilities who struggle with complex multi-column designs.

4. Keyboard & Touch Navigation: Accessibility requires that all functionality be available via keyboard. On mobile, this translates directly to touch-friendly navigation — large tap targets and logical focus order benefit both groups.

5. Avoiding Text in Images: Embedding text in images prevents screen readers from reading it and also causes blurry, unscalable text on high-DPI mobile screens. Using real HTML text solves both issues.

Conclusion

Web developers can support both accessibility and mobile devices by following a "one standard fits all" approach: semantic HTML5 elements, responsive CSS, descriptive alt text, and touch-friendly controls. The overlap between these guidelines shows that accessible design is inherently good mobile design — both aim to make content reachable by the widest possible audience.
